The activity of alkaline phosphatase in the aortic wall
of rats shows significant differences between male
and female animals and depends on the age of the ani-
mals, while this is not true of the activity of acid
phosphatase and aldolase. The total phosphorus in the
aortic wall, calculated as total nitrogen, continuously
decreases during the ageing process. Reserpine and
guanethidine reduce the activity of alkaline phosphatase
in the rat aorta, while the activity of acid phosphatase
is not changed. Epinephrine increases the
